Brief about your solution and problem statement addressing

SmartMess is an intelligent mess management system designed to improve food quality, reduce wastage, and enhance the student dining experience using real-time data. The primary aim of the project is to analyze crowd levels in the mess by comparing live attendance with available seating capacity and predict the best time for students to have their meals. This helps avoid overcrowding, ensures smoother meal distribution, and prevents sudden high demand that often degrades food quality.

In addition, SmartMess enables students to provide food feedback, helping mess authorities continuously improve meal quality. The provided constructive and meal-specific feedback allows the mess to prepare food more accurately and significantly reduce wastage. Daily menus can be created and displayed digitally for easy access. Overall, SmartMess creates a more efficient, transparent, and sustainable mess ecosystem for both students and managers.

Opportunities

- a. How different is it from any of the other existing ideas?
 - Our idea of SmartMess is different because it is a Data-Driven Solution, It predicts the crowd for next 15 minutes, using a simple Regression model, thus providing students an optimum time to go to the mess and prevent over-crowding problems.
 - SmartMess, is not just a plain review system meant for increasing mess quality, but a comprehensive solution that integrates major aspects to address the problems of students, regarding over-crowding, food quality with a sophisticated feedback system, and a beginner friendly UI.

Opportunities

b. How will it be able to solve the problem?

- SmartMess solves the problem of overcrowding in a very unique way. It does so by collecting the data for the number of students going inside the mess in a slot of 15 minutes, and using the Machine Learning algorithm for that specific mess and slot, it trains the model using that data.
- It makes use of this trained model to predict the crowd levels for next 15 minutes slot, thus effectively showing the “optimum” timing for mess-visit, and reducing the chances of over-crowding at mess.

List of features offered by the solution

1. Attendance Marker
 1. Students can mark attendance via a QR Code generated by Manager. This QR code is valid for a period of 15 minutes Slot only and can be generated.
 2. However, in case there is some problem in marking the attendance by QR, a manual Attendance marker is also setup
 3. This feature ensures **Mess isolation** (eg, attendance marked by student of alder mess doesn't show up in oak's manager Analytics)
 4. This is achieved by creating an Authentication service, and having different login pages and UI for both students and Managers
 5. This attendance can be used as a counter for students inside the mess (for a period of 15 minutes), and perform Analytics and ML crowd predictions

2. Crowd Prediction

1. The ML model incorporated performs crowd prediction in the interval of every 15 minutes, using the data collected by marking attendance in that period
2. The predicted crowd level is shown in student's UI indicating the “best” time for Mess visit
3. The underlying logic is optimized so that the predictions are available for “mess-open” timings only.

3. Review System

1. A separate, independent and anonymous review system is integrated
2. Students can give reviews for that specific slot of mess (Breakfast, Lunch, Dinner), which will be displayed on the Analytics section of Manager's UI
3. The review will be anonymous and the underlying logic Ensures there is **Mess Isolation**.

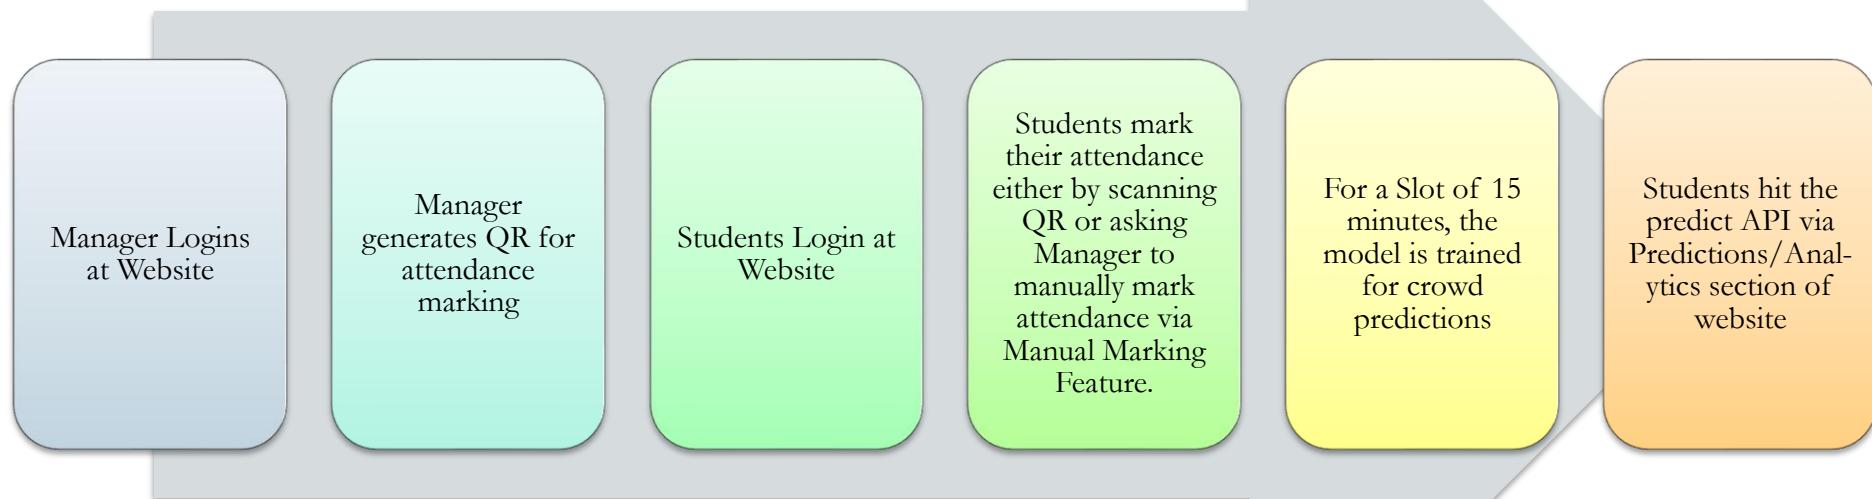

4. Menu Creation

1. The Managers can create the menu for specific slot of the day (Breakfast, Lunch, Dinner)
2. This menu will be displayed on the student's UI for that mess only, thus ensuring **Mess Isolation**
3. However, this feature is currently not integrated in the actual build of MVP, due to time restrictions

Google Technologies used in the solution

- Flutter and Dart (For Frontend UI)
- TensorFlow (For ML Crowd Prediction Model)
- Firebase Firestore (For Database)
- Google Cloud, GCP (For Hosting)

Process flow diagram or Use-case diagram

Architecture diagram of the proposed solution

ML Model

- /train API to train the model with parameter passed for the mess information using the Linear Regression algorithm
- /predict API to predict the crowd level for next 15 minutes slot

FrontEnd Student

- Student Login System by fetching data from Firebase Firestore Database in loginCredentials collection.
- Student Features include marking attendance via QR code, submitting meal review, viewing menu and analytics including Predictions.

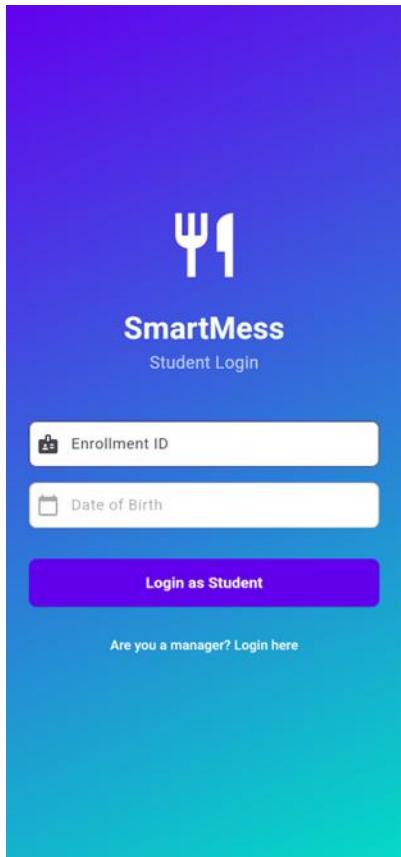

FrontEnd Manager

- Manager Login System by fetching email and raw password (currently without hashing for simplicity) from Firebase Firestore Database in the same collection.
- Manager features include QR code generation, manual attendance marking, creation of menus and viewing analytics including predictions.

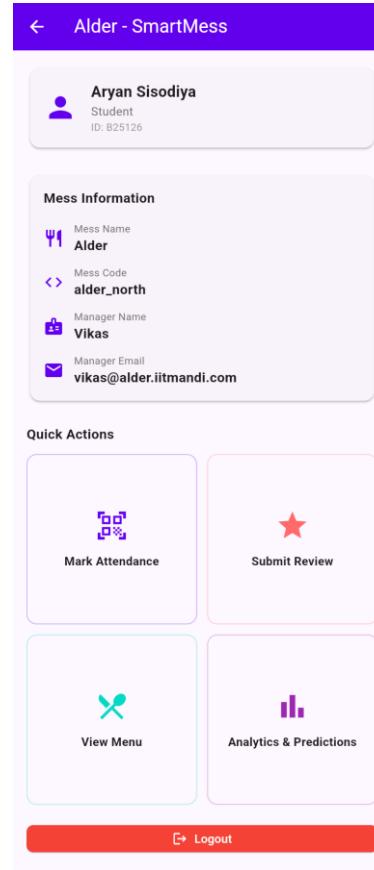

BackEnd

- Runs at the flask Backend server.
- Handles APIs including authentication for manager and student, Attendance API (/attendance), fetching Student, Mess and manager details, (eg: /manager-info), Menu Creation and viewing, Feedback processing and showing predictions.
- Handles the ML Model APIs including /predict and /train APIs.

Snapshots of the MVP (Web App)

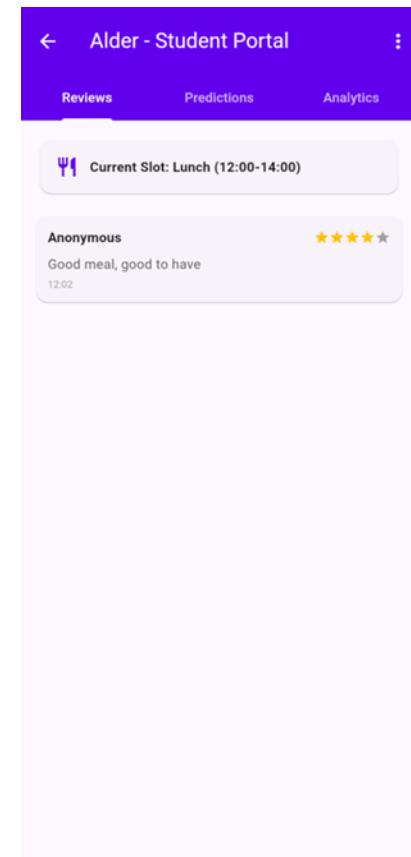

Student Web Login Screen

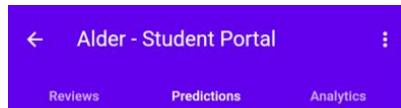

The Student Home Screen has a purple header bar with the text "Alder - SmartMess". The main content area shows a user profile for "Aryan Sisodiya" (Student, ID: B25126) with a blue person icon. Below is a "Mess Information" section with details: "Mess Name: Alder", "Mess Code: alder_north", "Manager Name: Vikas", and "Manager Email: vikas@alder.iitmandi.com", each with its respective icon. A "Quick Actions" section contains four cards: "Mark Attendance" (blue square icon), "Submit Review" (red star icon), "View Menu" (green fork and knife icon), and "Analytics & Predictions" (purple bar chart icon). A red "Logout" button is at the bottom.

Student Home Screen

The Student Review View Screen has a purple header bar with the text "Alder - Student Portal" and three dots on the right. The main content area includes a "Reviews" tab, a "Predictions" tab, and an "Analytics" tab. A review card for "Anonymous" is shown, stating "Good meal, good to have" at "12:02" with a timestamp icon. The review has a yellow star rating icon. A purple "Current Slot: Lunch (12:00-14:00)" message is also present.

Additional Details/Future Development (if any)

1. Authentication Methodology MUST be improved
 1. Currently, For student's authentication, DOB is used as password and Enrollment ID as login IDs, both the data is currently, stored directly in the database without hashing for simplicity and manual data addition at the database itself.
 2. Same goes for Manager's login too, currently, for testing purposes, a dummy email and dummy password is hardcoded directly in the database
 3. In the real, functioning model of the Project, there will be a dedicated Admin Page, where services like adding Manager's data will be there, and through that mechanism, the passwords will be stored perfectly via hashing.

2. Google Maps API integration

1. Google Maps API can be integrated to show the allotted mess's location in a web-integrated Map, along with Building details, like A19 3rd Floor for Alder Mess.
2. This will increase the ease of locating mess for new students
3. History section for manager's UI to see past attendance, crowd levels and reviews.
4. History section for student's UI to see their past attendance and submitted reviews.
5. Other Minor fixes:
 1. Adding service for "Forgot Password" in the Manager's Login Page
 2. Showing Mess Menu For whole week using a date-picker, instead of showing it just for the current day.
